

SOLID STATE

SPECIES BIBLE

Version 1.0 - Frozen Core Design

*Species answers: What does society expect this woman to become? The simulation answers:
How wrong were they?*

1. Purpose and Core Rule

This document defines the six playable species and how species affects gameplay, event probabilities, social treatment, morphology, transformation tendencies, and route opportunities.

Species influences expectations and probabilities. It does not dictate destiny.

An Elf may become concrete. A Dwarf may become porcelain. A Dragonkin may end as an inexpensive resin mannequin. A Human may become gold. These are unusual outcomes, not invalid ones.

2. Playable Roster

- Human
- Elf
- Dwarf
- Winged Kin
- Demonkin
- Dragonkin

The protagonist is female regardless of species. Orc is removed from the initial roster because its former STR-heavy industrial niche, low-CHR profile, and occupational satire overlapped too strongly with Dwarf.

3. Starting Balance

Every non-Human species should provide approximately one net point of inherent starting-stat value. Human receives that value as flexibility instead.

Species	CHR	INT	STR	MNY	SPR	Special
Human	-	-	-	-	-	+1 freely distributed point
Elf	+1	+1	-1	-	-	-
Dwarf	-1	-	+2	-	-	-
Winged Kin	+1	-	-1	-	+1	-
Demonkin	+2	-	-	-	-1	-
Dragonkin	-	-	+1	+1	-1	-

Human distributes 21 starting points. All other species distribute 20 before applying their species modifiers. These values remain subject to balance testing.

4. Species and Hidden Mechanics

Species must not create extra hidden numeric attributes. Fixation remains the only major hidden value in version 1. Species identity is expressed through starting stats, event eligibility, event-family tendency, route conditions, social treatment, and authored events.

Do not create hidden meters such as Elf Crystal Affinity, Dwarf Metal Resistance, Angelic Purity, Demon Corruption, or Dragon Value.

5. Event Drafting Model

Species tendencies only make sense inside a clearly defined drafting model. Solid State therefore uses hierarchical event drafting rather than one flat weighted pool.

5.1 Stage One - Channel Draft

For each age, the engine first builds a baseline channel profile. Age is the primary driver of this profile. Fixation, route state, talents, prior events, and major flags modify it.

- Ordinary - career, relationships, housing, education, hobbies, routine finances, uneventful years.
- Institutional / World - government, insurance, museums, legal changes, news, hospitals, social satire.
- Transformation - symptoms, partial conversion, material changes, preservation, temporal fixation, solidification incidents.
- Route / Special - rare talent routes, hidden chains, supernatural routes, major turning points.

The exact percentages belong in the implementation/balance specification, not this Bible. The important rule is that age supplies the baseline profile rather than every age drawing from the same global mixture.

5.2 Age-Driven Baseline

Different life phases should naturally produce different channel profiles. Early adult years should favor education, work, housing and relationship setup. Later phases may contain more institutional, health, Fixation, legacy, and ending-related events. Exact breakpoints and shares are data-driven and simulation-tested.

Hidden or strongly committed routes may later override normal channel drafting with higher priority. That route-priority system is intentionally left for the Route Bible and implementation spec.

5.3 Stage Two - Event Family

After a channel is selected, the engine selects an eligible family. Species tendencies act primarily here.

Transformation families can include stone, metal, crystal, glass, wood, ceramic, synthetic, temporal, and mixed/anomalous. Institutional families can include government, corporation, museum, hospital, finance, religion, family, and education.

Species should usually change what kind of transformation occurs, not how often life is interrupted by transformation.

5.4 Stage Three - Specific Event

Once a family is chosen, the engine drafts a specific eligible event. Event-local weights and talents distinguish common incidents, rare variants, and special branches.

5.5 Eligibility Fallback

If the selected family has no eligible event, renormalize across the remaining eligible families. If a whole channel has no eligible event, renormalize across the remaining channels. `noRandom` chained events bypass this process.

6. Species Tendency Vocabulary

This Bible deliberately does not publish numerical tendency multipliers. Exact values would imply a strength before probability simulations establish what players can actually perceive.

Label	Meaning
Primary	Defining tendency. Experienced players should clearly notice it.
Secondary	Meaningful recurring tendency, but not dominant.
Neutral	No meaningful species bias.
Uncommon	Less likely but fully valid and reachable.

As a design target, Primary tendencies together should often account for roughly half or more of otherwise-neutral transformation-family selections when they are all eligible. This is a perceptual target, not an engine constant.

7. Shared Humanoid Body Plan

All playable species share a broadly compatible humanoid morphology: upright, bipedal, approximately Human-scale, tool-using, and able to participate in the same cities, schools, workplaces, currencies, and legal systems.

Society is historically Human-centered. Non-Human anatomy therefore creates accommodation problems rather than requiring separate civilizations.

8. Human-Centered Infrastructure

Mainstream clothing, office furniture, vehicles, helmets, medical scanners, beds, doors, and safety equipment were historically standardized around Human anatomy. Modern standards have improved access without eliminating friction.

Morphological inconvenience should appear as occasional species events, not dominate every run. Positive accommodation events are also required so the world feels functional rather than universally incompetent.

9. Human

Official Traditional Chinese: 人類

9.1 Identity and Gameplay

Humans lack pronounced magical/material specialization. Their outcomes are less predictable, and many institutions use Human biology as their baseline.

Starting benefit: +1 freely distributed point. Main strength: flexibility and broad event compatibility. Main weakness: fewer strong specialized route biases.

9.2 Tendencies

Primary: none. Secondary: none. Neutral: almost everything.

9.3 Social Position and Humor

Humans are treated as the demographic default, which provides subtle infrastructure and medical advantages without another explicit stat.

Your doctor confirms that the mineral growth is normal for a Human. You ask what normally happens next. She says that is the unpredictable part.

10. Elf

Official Traditional Chinese: 精靈

10.1 Morphology and Gameplay

Elves generally have pointed ears, slender builds, slow visible aging, and high magical responsiveness. Starting modifiers: CHR +1, INT +1, STR -1.

10.2 Transformation Tendencies

Primary: Crystal and Wood. Secondary: Glass and fine stone/marble. Neutral: ceramic, synthetic, precious metal and some temporal routes. Uncommon: heavy industrial metal and concrete.

10.3 Wood as a Major Elf Family

Wood is not a novelty subtype. It is one of the two defining Elf transformation families alongside crystal.

Arboreal Form

Tree-like permanent forms may feature visible grain, bark-like surfaces, root structures, branchlike hair, leaves, flowers, or irregular natural contours.

Sculptural Wood

The protagonist remains a clean humanoid statue formed from recognizably crafted wood such as oak, walnut, cedar, dark ornamental hardwood, or magical equivalents.

Polished / Finished Wood

Wood may be sanded, sealed, varnished, lacquered, polished, or otherwise professionally finished. Such forms may be extremely prestigious and valuable; wood must not imply rusticity or low status.

Carved / Reworked Wood

Permanent wooden forms may later be repaired, carved, engraved, refinished, or partially reshaped, creating consent, bodily-integrity, restoration, and artistic-ownership routes.

10.4 Social Pressure and Humor

Elf satire centers on aesthetic commodification and the assumption that Elves should become something beautiful.

Your preservation consultant recommends walnut. She says crystal is becoming predictable.

11. Dwarf

Official Traditional Chinese: 矮人

11.1 Morphology and Gameplay

Dwarves are shorter on average, broad-bodied, physically dense, and highly durable. Starting modifiers: STR +2, CHR -1.

11.2 Tendencies

Primary: Stone and industrial metal. Secondary: Bronze, concrete, architectural composite, industrial synthetic forms. Neutral: ceramic, wood, precious metal. Uncommon: glass and delicate crystal.

11.3 Social Pressure

Dwarf satire combines occupational normalization with Human-scale infrastructure. Their resilience creates employment opportunities and excuses for exposing them to more risk.

The new biometric terminal cannot detect your face. HR provides a stool. The stool is classified as a reasonable accommodation.

Your employer introduces a new mineral exposure limit. Dwarves are exempt.

12. Winged Kin

Official Traditional Chinese: 翼族

12.1 Formal and Everyday Naming

Winged Kin is the legal, medical, academic, and demographic term. Most people casually call them Angels / 天使. The informal term is culturally natural but scientifically inaccurate; individual Winged Kin vary in how much they care.

12.2 Morphology and Integration

Winged Kin possess wings ranging from large and functional to vestigial. White wings are a stereotype rather than the biological default. Chair backs, coats, vehicle restraints, scanners and older buildings can create accommodation issues.

12.3 Gameplay

Starting modifiers: CHR +1, SPR +1, STR -1. Main strengths: ceremonial, social, memorial and religious routes. Main pressure: symbolic objectification.

12.4 Tendencies

Primary: Marble and pale/fine stone. Secondary: Crystal and temporal fixation. Neutral: wood, ceramic, synthetic, precious metal. Uncommon: crude industrial forms.

You explain that you work in payroll. The journalist asks what you symbolize.

The government rejects "Angel" as your species on Form 7B. Form 7C uses the word three times.

13. Demonkin

Official Traditional Chinese: 魔裔

13.1 Everyday Naming and Morphology

Demonkin is the formal term. Demon / 惡魔 is everyday speech. Demonkin may have horns, tails, unusual eyes, markings, or atypical skin coloration, while remaining broadly compatible with shared infrastructure.

13.2 Gameplay

Starting modifiers: CHR +2, SPR -1. Main strengths: charisma, occult systems, contracts and unusual magical outcomes. Main pressures: emotional volatility and institutional suspicion.

13.3 Tendencies

Primary: Obsidian and dark glass. Secondary: Precious metal, magical seal forms, temporal fixation. Neutral: stone, synthetic, ceramic, crystal. Uncommon: natural wood.

13.4 Social Pressure and Humor

Demonkin satire centers on presumed dangerous or contractual intent. Mundane institutions should frequently be more exploitative than anything supposedly demonic.

The bank requests an occult-contract disclosure. You are opening a savings account.

14. Dragonkin

Official Traditional Chinese: 龍人族

14.1 Naming

Dragonkin replaces the earlier name Drakekin. "Drake" has inconsistent fantasy meanings and may imply a narrower dragon subtype. Dragonkin more directly communicates humanoid people with draconic traits.

Preferred Traditional Chinese formal term: 龍人族. Colloquial: 龍人. Avoid 龍裔 as the primary translation because it can suggest a Dragonborn-like chosen lineage rather than a population.

14.2 Morphology and Integration

Dragonkin may have scales, horns, tails, reptilian eyes, unusual body temperature, and occasionally small or vestigial wings. Tails, horns, scales, and thermal differences create occasional seating, helmet, medical-sensor, biometric, and transit problems.

14.3 Gameplay

Starting modifiers: STR +1, MNY +1, SPR -1. Main strengths: durability, finance, prestige and valuable-material routes. Main pressure: aggressive economic valuation of the body.

14.4 Tendencies

Primary: Precious metal and gemstone. Secondary: Bronze, volcanic stone, crystal. Neutral: ordinary stone, synthetic, glass, ceramic. Uncommon: wood.

The bank approves the loan after reviewing your projected post-mobility value. You are nineteen.

The building thermal scanner reports that you have a severe fever. You are healthier than the scanner.

15. Species Integration into Shared Society

All six species attend the same schools, use the same currencies, work in the same companies, live in the same cities, and participate in the same legal framework. Non-Human features are therefore not an obstacle to the premise; they are a source of differentiated social experience.

The design target is "usable but sometimes inconvenient," not "separate fantasy civilization." Accommodation can affect clothing, workstations, transit, medical equipment, insurance, housing, or safety standards.

16. Species-Specific Event Frequency

Species should color a run without dominating it. Approximately 10-15% of encountered events may strongly depend on species. Most events should remain driven by age, stats, talents, institutions, Fixation, and event history.

17. Transformation Tendency Summary

Species	Primary	Secondary
Human	None	None
Elf	Crystal, Wood	Glass, fine stone
Dwarf	Stone, industrial metal	Bronze, concrete
Winged Kin	Marble, pale stone	Crystal, temporal

Demonkin	Obsidian, dark glass	Precious metal, magical seal, temporal
Dragonkin	Precious metal, gemstone	Bronze, volcanic stone, crystal

This table is qualitative and must not be translated directly into arbitrary numerical multipliers.

18. Contradicting Expectations

Some memorable outcomes should deliberately violate species stereotypes: Elf -> reinforced concrete; Dwarf -> delicate porcelain; Winged Kin -> commercial mannequin; Demonkin -> pale maple; Dragonkin -> inexpensive resin; Human -> exceptionally pure gemstone.

Such results should be less common but never treated as invalid.

19. Synthetic and Temporal Forms

Every species can become synthetic forms such as mannequin, resin, polymer, composite, or artificial stone. Synthetic does not mean cheap: custom archival mannequin bodies and bespoke engineered forms may be luxury outcomes.

Temporal Fixation is also available to every species. Species changes the social context more than the fundamental possibility: corporate stasis for Humans, research preservation for Elves, industrial safety locks for Dwarves, eternal-vigil symbolism for Winged Kin, magical seals for Demonkin, and asset preservation for Dragonkin.

20. Species Reveal UI Direction

Species reveal should communicate modifiers, broad associations, and one deadpan institutional joke. It should not expose exact family weights.

SPECIES REGISTRATION - WINGED KIN

CHR +1 / SPR +1 / STR -1

Common associations: marble, memorialization.

Informal designation: Angel.

SPECIES REGISTRATION - DRAGONKIN

STR +1 / MNY +1 / SPR -1

Common associations: precious metals, gemstones.

Please ignore unsolicited valuation estimates.

21. Approved Terminology

Formal English	Traditional Chinese	Common English	Common Chinese
Human	人類	Human	人類
Elf	精靈	Elf	精靈
Dwarf	矮人	Dwarf	矮人
Winged Kin	翼族	Angel	天使
Demonkin	魔裔	Demon	惡魔
Dragonkin	龍人族	Dragon / Dragonfolk	龍人

22. Frozen Design Rules

1. Use hierarchical drafting: age/state channel -> family -> specific event.
2. Age is the primary source of baseline channel weights; Fixation, route state, talents and history modify them.
3. Hidden or committed routes may later override normal drafting at higher priority.
4. Species tendencies operate primarily at the event-family stage.
5. Do not publish unvalidated numerical species multipliers in this Bible.
6. Primary tendencies must be perceptible in ordinary play.
7. Species never makes a major material impossible.
8. Human remains mechanically attractive through flexible allocation.
9. Dwarf owns the durable/industrial niche; Orc is removed from version 1.
10. Elf has Wood and Crystal as co-primary transformation families.
11. Wood may be natural, sculptural, polished, lacquered, carved, repaired or otherwise finished.
12. Winged Kin is formal; Angel is everyday speech.
13. Dragonkin replaces Drakekin; 龍人族 is the formal Traditional Chinese term.
14. Society is historically Human-centered but all playable species share a compatible humanoid body plan.
15. Morphology creates accommodation events, not separate societies.
16. Synthetic forms are not inherently cheap.
17. Temporal Fixation is valid for every species.
18. Species stereotypes are expectations, not objective destinies.
19. No base species should feel like a bad roll.
20. Species should affect story identity more than raw power.

23. Core Species Principle

Species asks what society expects this woman to become. The event engine decides how much this particular life follows - or violates - that expectation.
